

Part 5 – Final Reflection

Write 200–300 words describing your learning experience during this lab.

During this lab, I learned many new things about computer hardware and embedded systems. One thing that surprised me about computer hardware was how many small components work together inside a computer system. Before this lab, I only knew about common parts like the keyboard, monitor, and mouse, but I did not understand how important components such as the motherboard, RAM, storage, and power supply are for the computer to function properly. I was surprised to see how all the hardware parts are connected and communicate with each other.

The component that was completely new for me was the Raspberry Pi. I had never used it before, and I found it very interesting because such a small device can work like a complete computer. I learned that it is widely used in embedded systems, robotics, and programming projects. It helped me understand that embedded systems are designed for specific tasks and are commonly used in everyday electronic devices.

I also faced some challenges during the lab. Firstly, I was unable to connect the Raspberry Pi to the same network, which made it difficult to continue the setup process. Secondly, I had some difficulty connecting the keyboard and mouse wires correctly. However, after following the instructions carefully, I was able to solve these problems.

Overall, this lab improved my understanding of hardware components and embedded systems. It also helped me develop problem-solving skills and practical experience with computer setup and networking.
